EDUCATION

Yeditepe University

Bachelor of Science in Computer Engineering (GPA: 3.46/4.00)

İstanbul

Sep. 2021 – Feb. 2026

EXPERIENCE

Software Design Intern

July 2025 – Aug. 2025

Token Financial Technologies

İstanbul

- Engineered a high-performance URL shortening API with NestJS (Node.js/TypeScript) and Redis, utilizing in-memory caching for low-latency redirections and Docker for consistent deployment.
- Evaluated architectural trade-offs across the stack, including infrastructure selection, collision-resistant key generation logic, and caching strategies to ensure maintainability.
- Developed comprehensive Postman API documentation to facilitate standardized integration and ensure a seamless technical handover to the core development team.
- Participated in Agile sprint ceremonies, including daily stand-ups and progress tracking, to ensure milestone alignment within the development cycle.

PROJECTS

URL Shortener | *Node.js, TypeScript, NestJS, Redis, Docker, DigitalOcean* | [Website Link](#) July 2025 – Aug. 2025

- Engineered a high-performance URL shortening API using NestJS (Node.js/TypeScript) and Redis, implementing a custom backend-driven HTML submission form and 404 redirection page.
- Automated quality assurance by implementing Integration Tests to validate API endpoints and database interactions under various traffic scenarios.
- Deployed and managed the live service on a DigitalOcean Droplet.

NeuralArt | *FastAPI, Next.js, TensorFlow, Celery, Redis, S3, Docker*, | [Website Link](#) Feb. 2026 – Present

- Architected a full-stack AI platform featuring a high-performance RESTful API developed with FastAPI (Python) and a Next.js (React, TypeScript) frontend to perform Neural Style Transfer.
- Engineered an asynchronous Celery/Redis pipeline to decouple TensorFlow workloads from the RESTful service, ensuring a non-blocking UI and secure S3 (DigitalOcean Spaces) storage via pre-signed URLs.
- Launched the multi-service application on a DigitalOcean Droplet using Docker, ensuring a consistent and scalable production environment for the AI processing pipeline.

Photonamer | *Python, Typer, MLX, Qwen-VL, PyPi* | [PyPi Link](#) March. 2026 – Present

- Developed a fully offline command-line interface (CLI) tool using Python and Typer to automatically bulk-rename image files based on their visual subject, lighting, and composition.
- Engineered an on-device AI inference pipeline utilizing Apple's MLX framework to run a quantized Vision-Language Model (Qwen2.5-VL), leveraging unified memory for zero-latency extraction of compositional techniques and mood.
- Packaged and published the application to the Python Package Index (PyPI), enabling seamless global distribution and zero-configuration installation via pipx.

Encrypted Network Traffic Classifier | *Python, PyTorch, Scapy, Streamlit* Oct. 2025 – Jan. 2026

- Developed a hybrid deep learning model combining CNNs for and Transformers to classify encrypted network traffic.
- Engineered a data preprocessing pipeline using Scapy to transform raw packet captures into structured tensors for high-accuracy model training.
- Architected a real-time network monitoring dashboard using Streamlit, integrating live traffic sniffing directly from the NIC for instant classification and visualization.

TECHNICAL SKILLS

Languages: TypeScript, Java, Python, C/C++, SQL

Frameworks & APIs: Node.js, NestJS, Next.js, React, PyTorch, Spring Boot, FastAPI, Streamlit, RESTful APIs

Developer Tools: Git, Docker, Redis, MySQL, PostgreSQL, Postman, Render, DigitalOcean, S3

Libraries: Scapy, Scikit-learn, Pandas, NumPy
